

WEEK:- 20

Topic: Electricity Monitoring Module Development, Calculations, Reporting, and Testing

Objectives:

To develop an Electricity Monitoring module, implement calculation logic, generate reports, and perform testing to ensure accurate monitoring and reporting.

Learning Outcomes:

- Learned electricity monitoring system concepts and workflows.
- Understood calculation and reporting implementation techniques.
- Gained knowledge of module development and testing methodologies.
- Developed skills in data analysis and report generation.
- Improved understanding of monitoring and management systems.

WORK SUMMARY:

During Week 20, I worked on Electricity Monitoring module development, calculations, reporting, and testing. The training focused on creating a system capable of monitoring electricity-related data, performing calculations, and generating meaningful reports. I attended technical sessions and participated in practical exercises to understand the requirements and functionality of monitoring systems.

Throughout the week, I gained practical experience in implementing calculation logic, managing data inputs, and generating reports based on collected information. I learned how monitoring systems help organizations track resource consumption and support data-driven decision-making. Special emphasis was placed on ensuring calculation accuracy, report reliability, and overall system performance. I also conducted testing activities to verify functionality and identify areas for improvement.

The activities carried out during this week strengthened my software development and analytical skills. Regular testing, debugging, and mentor feedback helped me refine the module and improve its efficiency. The knowledge gained during this week enhanced my understanding of monitoring systems and practical business application development.

Activities Performed:

- Developed electricity monitoring functionalities and calculation modules.
- Generated reports and performed testing to validate system accuracy.
